

Limits of Generalized Mean Expectations

Vu Hung Nguyen, vuhung16plus@gmail.com

1 Overview

This document evaluates the limits of expectations of generalized means H_p over the unit hypercube $[0, 1]^n$ as $n \rightarrow \infty$, where $H_p = \left(\frac{1}{n} \sum_{i=1}^n x_i^p\right)^{1/p}$ for various values of p , including special cases such as minimum, maximum, harmonic, geometric, arithmetic, root mean square, and cubic means.

2 Problem Statements

2.1 Generalized Mean

For a real parameter $p \neq 0$, the generalized mean (or power mean) is defined as:

$$H_p(\mathbf{x}) = \left(\frac{1}{n} \sum_{i=1}^n x_i^p \right)^{1/p}.$$

We seek to evaluate:

Problem 1. For $p \in \mathbb{R} \setminus \{0\}$, find

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^p \right)^{1/p} dx_1 \cdots dx_n.$$

2.2 Special Cases

We also consider the following special cases:

Problem 2 (Minimum Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \min(x_1, x_2, \dots, x_n) dx_1 \cdots dx_n.$$

Problem 3 (Maximum Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \max(x_1, x_2, \dots, x_n) dx_1 \cdots dx_n.$$

Problem 4 (Harmonic Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \frac{n}{\sum_{i=1}^n \frac{1}{x_i}} dx_1 \cdots dx_n.$$

Problem 5 (Geometric Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\prod_{i=1}^n x_i \right)^{1/n} dx_1 \cdots dx_n.$$

Problem 6 (Arithmetic Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \frac{1}{n} \sum_{i=1}^n x_i dx_1 \cdots dx_n.$$

Problem 7 (Root Mean Square).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^2 \right)^{1/2} dx_1 \cdots dx_n.$$

Problem 8 (Cubic Mean).

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^3 \right)^{1/3} dx_1 \cdots dx_n.$$

3 Key Ideas

The solutions rely on two fundamental tools:

1. **The Fubini-Tonelli Theorem:** This allows us to exchange the order of integration and factorize integrals over independent variables. For independent random variables X_1, \dots, X_n uniformly distributed on $[0, 1]$, we can write:

$$E[f(X_1, \dots, X_n)] = \int_{[0,1]^n} f(x_1, \dots, x_n) dx_1 \cdots dx_n = \int_0^1 \cdots \int_0^1 f(x_1, \dots, x_n) dx_1 \cdots dx_n.$$

2. **Strong Law of Large Numbers (SLLN):** For i.i.d. random variables X_1, X_2, \dots with finite expectation $E[X]$, we have:

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n X_i = E[X] \quad \text{almost surely.}$$

For the case when $E[X] = \infty$ (as in the harmonic mean), a generalized version applies, stating that the sample mean converges to infinity almost surely.

4 Solutions

4.1 Solution for Generalized Mean H_p

For $p \neq 0$, we interpret the integral as an expectation:

$$I_n^{(p)} = \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^p \right)^{1/p} dx_1 \cdots dx_n = E \left[\left(\frac{1}{n} \sum_{i=1}^n X_i^p \right)^{1/p} \right],$$

where X_1, \dots, X_n are i.i.d. $\text{Unif}(0, 1)$.

By the Strong Law of Large Numbers, $\frac{1}{n} \sum_{i=1}^n X_i^p \rightarrow E[X_1^p]$ almost surely. Since $E[X_1^p] = \int_0^1 x^p dx = \frac{1}{p+1}$ for $p > -1$, we have:

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n X_i^p = \frac{1}{p+1} \quad \text{a.s.}$$

Taking the $1/p$ -th power (which is continuous for $p \neq 0$):

$$\lim_{n \rightarrow \infty} \left(\frac{1}{n} \sum_{i=1}^n X_i^p \right)^{1/p} = \left(\frac{1}{p+1} \right)^{1/p} \quad \text{a.s.}$$

Since the generalized mean is bounded (for $x_i \in [0, 1]$ and $p > 0$, we have $H_p \in [0, 1]$; for $p < 0$, appropriate bounds exist), the Dominated Convergence Theorem applies:

$$\lim_{n \rightarrow \infty} I_n^{(p)} = E \left[\lim_{n \rightarrow \infty} \left(\frac{1}{n} \sum_{i=1}^n X_i^p \right)^{1/p} \right] = \left(\frac{1}{p+1} \right)^{1/p}.$$

Solution.

$$\boxed{\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^p \right)^{1/p} dx_1 \cdots dx_n = \left(\frac{1}{p+1} \right)^{1/p}}$$

4.2 Solution for Minimum Mean

Let $M_n = \min(X_1, \dots, X_n)$ for i.i.d. $X_i \sim \text{Unif}(0, 1)$. The probability that $M_n > t$ is:

$$P(M_n > t) = P(X_1 > t, \dots, X_n > t) = (1-t)^n, \quad 0 < t < 1.$$

Using the identity $E[M_n] = \int_0^1 P(M_n > t) dt$:

$$E[M_n] = \int_0^1 (1-t)^n dt = \frac{1}{n+1}.$$

Taking the limit:

$$\lim_{n \rightarrow \infty} E[M_n] = \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0.$$

Solution.

$$\boxed{\lim_{n \rightarrow \infty} \int_{[0,1]^n} \min(x_1, x_2, \dots, x_n) dx_1 \cdots dx_n = 0}$$

4.3 Solution for Maximum Mean

Let $M'_n = \max(X_1, \dots, X_n)$ for i.i.d. $X_i \sim \text{Unif}(0, 1)$. The cumulative distribution function is:

$$F_{M'_n}(t) = P(M'_n \leq t) = P(X_1 \leq t, \dots, X_n \leq t) = t^n, \quad 0 \leq t \leq 1.$$

The probability density function is $f_{M'_n}(t) = nt^{n-1}$, so:

$$E[M'_n] = \int_0^1 t \cdot nt^{n-1} dt = n \int_0^1 t^n dt = \frac{n}{n+1}.$$

Taking the limit:

$$\lim_{n \rightarrow \infty} E[M'_n] = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1.$$

Solution.

$$\boxed{\lim_{n \rightarrow \infty} \int_{[0,1]^n} \max(x_1, x_2, \dots, x_n) dx_1 \cdots dx_n = 1}$$

4.4 Solution for Harmonic Mean

The harmonic mean is $H_n = \frac{n}{\sum_{i=1}^n \frac{1}{X_i}}$. Let $Y_i = \frac{1}{X_i}$. Then:

$$E[Y_i] = \int_0^1 \frac{1}{x} dx = \lim_{t \rightarrow 0^+} [\ln x]_t^1 = \infty.$$

Since $E[Y_i] = \infty$, the generalized SLLN implies:

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n Y_i = \infty \quad \text{a.s.}$$

Therefore:

$$\lim_{n \rightarrow \infty} H_n = \lim_{n \rightarrow \infty} \frac{1}{\frac{1}{n} \sum_{i=1}^n Y_i} = 0 \quad \text{a.s.}$$

Since $0 < H_n \leq 1$ (harmonic mean of numbers in $(0, 1]$ is bounded), the Dominated Convergence Theorem applies:

$$\lim_{n \rightarrow \infty} E[H_n] = E \left[\lim_{n \rightarrow \infty} H_n \right] = 0.$$

Solution.

$$\boxed{\lim_{n \rightarrow \infty} \int_{[0,1]^n} \frac{n}{\sum_{i=1}^n \frac{1}{x_i}} dx_1 \cdots dx_n = 0}$$

4.5 Solution for Geometric Mean

The geometric mean is $G_n = (\prod_{i=1}^n X_i)^{1/n}$. By the Fubini-Tonelli Theorem and independence:

$$E[G_n] = \int_{[0,1]^n} \left(\prod_{i=1}^n x_i \right)^{1/n} dx_1 \cdots dx_n = \prod_{i=1}^n \int_0^1 x_i^{1/n} dx_i = \left(\int_0^1 x^{1/n} dx \right)^n.$$

Since $\int_0^1 x^{1/n} dx = \frac{n}{n+1}$:

$$E[G_n] = \left(\frac{n}{n+1} \right)^n.$$

Taking the limit:

$$\lim_{n \rightarrow \infty} E[G_n] = \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n = \lim_{n \rightarrow \infty} \frac{1}{(1 + 1/n)^n} = \frac{1}{e}.$$

Solution.

$$\boxed{\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\prod_{i=1}^n x_i \right)^{1/n} dx_1 \cdots dx_n = \frac{1}{e}}$$

4.6 Solution for Arithmetic Mean

The arithmetic mean is $A_n = \frac{1}{n} \sum_{i=1}^n X_i$. By the SLLN:

$$\lim_{n \rightarrow \infty} A_n = E[X_1] = \int_0^1 x dx = \frac{1}{2} \quad \text{a.s.}$$

Since $A_n \in [0, 1]$, the Dominated Convergence Theorem gives:

$$\lim_{n \rightarrow \infty} E[A_n] = E \left[\lim_{n \rightarrow \infty} A_n \right] = \frac{1}{2}.$$

Solution.

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \frac{1}{n} \sum_{i=1}^n x_i dx_1 \cdots dx_n = \frac{1}{2}$$

4.7 Solution for Root Mean Square

The root mean square is $R_n = (\frac{1}{n} \sum_{i=1}^n X_i^2)^{1/2}$. By the SLLN:

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n X_i^2 = E[X_1^2] = \int_0^1 x^2 dx = \frac{1}{3} \quad \text{a.s.}$$

Taking the square root:

$$\lim_{n \rightarrow \infty} R_n = \sqrt{\frac{1}{3}} = \frac{1}{\sqrt{3}} \quad \text{a.s.}$$

Since $R_n \in [0, 1]$, the Dominated Convergence Theorem applies:

$$\lim_{n \rightarrow \infty} E[R_n] = \frac{1}{\sqrt{3}}.$$

Solution.

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^2 \right)^{1/2} dx_1 \cdots dx_n = \frac{1}{\sqrt{3}}$$

4.8 Solution for Cubic Mean

The cubic mean is $C_n = (\frac{1}{n} \sum_{i=1}^n X_i^3)^{1/3}$. By the SLLN:

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n X_i^3 = E[X_1^3] = \int_0^1 x^3 dx = \frac{1}{4} \quad \text{a.s.}$$

Taking the cube root:

$$\lim_{n \rightarrow \infty} C_n = \left(\frac{1}{4} \right)^{1/3} = \frac{1}{\sqrt[3]{4}} \quad \text{a.s.}$$

Since $C_n \in [0, 1]$, the Dominated Convergence Theorem applies:

$$\lim_{n \rightarrow \infty} E[C_n] = \frac{1}{\sqrt[3]{4}}.$$

Solution.

$$\lim_{n \rightarrow \infty} \int_{[0,1]^n} \left(\frac{1}{n} \sum_{i=1}^n x_i^3 \right)^{1/3} dx_1 \cdots dx_n = \frac{1}{\sqrt[3]{4}}$$

5 Further Works and Open Problems

Several directions for future research emerge:

1. **Generalized means for $p < -1$:** The case $p < -1$ requires careful analysis since $E[X_1^p]$ may not exist. The behavior of the limit as $p \rightarrow -1^-$ (approaching the harmonic mean from below) is of particular interest.

2. **Non-uniform distributions:** Extending these results to other probability distributions on $[0, 1]$ or to unbounded domains would provide a more general theory.
3. **Convergence rates:** While we have established the limits, the rate of convergence (e.g., $O(1/n)$ for arithmetic mean) could be studied more systematically.
4. **Multivariate extensions:** Generalizing to integrals over $[0, 1]^{n \times d}$ for $d > 1$ or to other geometric domains.
5. **Connection to order statistics:** The minimum and maximum cases are directly related to order statistics. A unified treatment connecting all means through order statistics might yield deeper insights.

6 Conclusions

We have evaluated the limits of expectations of various generalized means over the unit hypercube $[0, 1]^n$ as $n \rightarrow \infty$. The key results are summarized in Table 1.

Mean Type	Limit
Generalized Mean H_p ($p \neq 0$)	$\left(\frac{1}{p+1}\right)^{1/p}$
Minimum	0
Maximum	1
Harmonic Mean ($p = -1$)	0
Geometric Mean ($p \rightarrow 0$)	$\frac{1}{e}$
Arithmetic Mean ($p = 1$)	$\frac{1}{2}$
Root Mean Square ($p = 2$)	$\frac{1}{\sqrt{3}}$
Cubic Mean ($p = 3$)	$\frac{1}{\sqrt[3]{4}}$

Table 1: Summary of limit results for various means.

The solutions demonstrate the power of probabilistic methods (interpreting integrals as expectations) combined with fundamental convergence theorems (SLLN, Dominated Convergence Theorem) to solve high-dimensional integration problems. The results show interesting patterns: the minimum and harmonic means converge to 0, the maximum converges to 1, while other means converge to intermediate values that depend on the parameter p .
